Bridging the gap between quantitative and qualitative approaches, Embedded Case Study Methods presents methods for interrelating and integrating the variables, findings, and evaluations from the facets of the case (i.e., different perspectives of inquiry such as participant observation, open-ended interviews, etc.) or sub-units of case inquiry. Using case examples from five different disciplines (neuropsychology, education, law, business, and environmental sciences), the authors show the

Combining the case method with other methods. Some researchers combine case studies with other methods, such as a survey: for example, you could conduct a survey of several local councils, and provide a case study of one council. This type of approach has the benefit of combining qualitative and quantitative research.

The nested case-control study can be analyzed using methods for missing covariates. The NCC design is often used when the exposure of interest is difficult or expensive to obtain and when the outcome is rare. By utilizing data previously collected from a large cohort study, the time and cost of beginning a new case-control study is avoided.

An embedded case study is a case study containing more than one sub-unit of analysis (Yin, 2003). Similar to a case study, an embedded case study methodology provides a means of integrating quantitative and qualitative methods into a single research study (Scholz & Tietje, 2002; Yin 2003). However, the identification of sub-units allows for a more detailed level of inquiry.
