## Compound Name Formula Search -- EndMemo

When we're looking at the formulas for compounds with polyatomic ions, we have to be careful in the way that we write them. When I look at something like barium hydroxide, remember that barium is Ba, and has a 2 plus charge. Hydroxide, has a minus 1 charge. When I form my compound, and get the formula, I

Students would then write the formula for the ionic compound and the corresponding name. It was a fun way for students to practice formula writing yet wasn't daunting or seem as boring to a student as a worksheet full of practice questions. This year due to restrictions in sharing lab materials a digital alternative was needed.

An ionic formula, like  $\text{NaCl}$ , is an empirical formula. This formula merely indicates that sodium chloride is made of an equal number of sodium and chloride ions. Sodium sulfide, another ionic compound, has the formula  $\text{Na}_2\text{S}$ . This formula indicates that this compound is made up of twice as many sodium ions as sulfide ions.

Instructions Before viewing an episode, download and print the note-taking guides, worksheets, and lab data sheets for that episode, keeping the printed sheets in order by page number. During the lesson, watch and listen for instructions to take notes, pause the video, complete an assignment, and record lab data. See your classroom teacher for specific instructions.

For example, the ionic compound sodium oxalate is comprised of Na<sup>+</sup> and  $[\text{C}_2\text{O}_4]^{2-}$  ions combined in a 2:1 ratio, and its formula is written as Na<sub>2</sub>C<sub>2</sub>O<sub>4</sub>. The subscripts in this formula are not the smallest-possible whole numbers, as each can be divided by 2 to yield the empirical formula, NaCO<sub>2</sub>.

LAB: PROPERTIES OF IONIC COMPOUNDS (50pts)  
Introduction. The goal of this lab is for you to discover some of the properties of ionic compounds. The physical properties of a substance such as flame color, crystal structure, solubility, conductivity and melting point of a substance tell us a lot about the type of bonding in a compound.

Write the formula using the smallest whole number ratio between the cation and anion to balance charge. If the charges of the cation and anion are equal (e.g., +1/-1, +2/-2, +3/-3), then combine the cation and anion in a 1:1 ratio. An example is potassium chloride, KCl.
