NACE TM0284 is the most common test for hydrogen-induced cracking. Many carbon steels are susceptible to hydrogen-induced cracking. Exposure to H<sub>2</sub>S results in the formation of molecular hydrogen at discontinuities, leading to internal cracking. Often the cracks form a stepwise or linear path in the material, known as stepwise cracking.

Foreword . Absorption of hydrogen generated by corrosion of steel in a wet hydrogen sulfide (H<sub>2</sub>S) environment can have several effects that depend on the properties of the steel, manufacturing or forming processes, the characteristics of the environment, and other variables. One adverse effect observed in pipeline and pressure vessel steels is the development of cracks along the rolling ...
